Network design

This part of the document describes the kind of network we are going to deliver. First off, the most important part of designing the network is making it fast and reliable. Doing so we need to break the network up in smaller parts to insure fast data traffic, this is called subnets. We will make de subnets as small as possible this will decrease network collisions and therefore increase network speed.

Reliability is also very important to ensure maximum network uptime. We think it's best to use a form of backup where we connect all network devices to switches. And make sure they overlap all there connections. For example: when one router would break all the network traffic would be going to the second router. This will also work with high demand data traffic. When there is a spike of traffic at one side of the network. It will load balance the data to the rest of the network.

Network configuration

We plan to use the following network configuration. What is optimized for speed and load balancing.

	Subnet ID	First adress	Last Adress	Broadcast adress	Subnetmask
subnet 1	192.168.0.0/29	192.168.0.1	192.168.0.6	192.168.0.7	255.255.255.248
subnet 2	192.168.0.8/29	192.168.0.9	192.168.0.14	192.168.0.15	255.255.255.248
subnet 3	192.168.0.16/30	192.168.0.17	192.168.0.18	192.168.0.19	255.255.255.252
subnet 4	192.168.0.20/30	192.168.0.21	192.168.0.22	192.168.0.23	255.255.255.252
